"FBP WW domains and the Abl SH3 domain bind to a specific class of proline-rich ligands.";

"FBP WW domains and the Abl SH3 domain bind to a specific class of EMBO J. 16.2376-23831199;

-I FUNCTION: Transcriptional activator that binds to the AT-rich core sequence of the enhancer element of the AFP gene.

-I SUBGINIT: Interaction with FNBED.

-I SUBCELLULAR LOCATION: Woclear.

-I SIMILARITY: Contains 4 homeobox domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            [1]

Clinical features are myoclonus epilepsy, dementia, and cerebellar ataxia. Onset of the disease occurs usually in the second decade of life and death in the fourth.

CAUTION: Ref.2 sequence differs from that shown due to several
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -1- POLYMORPHISM: The poly-Gln region of DRPLA is highly polymorphic (7 to 23 repeats) in the normal population and is expanded to about 49-75 repeats in DRPLA parients. Longer expansions result in earlier onset and more severe clinical manifestations of the

BIOL. 205:309-321(1999).
-!- TISSUE SPECIFICITY: CNS STEM CELLS.
-!- DEVELOPMENTAL STAGE: UPON TERMINAL NEURAL DIFFERENTIATION, NESTIN IS DOWN-REGULATED AND REPLACED BY NEUROFILAMENTS.
-!- SIMILARITY: Belongs to the intermediate filament family.
                                                                                                                                                                                                                                                                              Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DISEASE: Implicated in a subset of acute myeloid leukemia (acute myeloid controlymbrocytic leukemia) (AML) carrying a chromosomal translocation t(6;9) (p23;q34) that results in the formation of a DEK.CAN fusion gene.

DISEASE: Involved in some cases of acute undifferentiated leukemia (AUL) through a chromosomal translocation t(6;9) (q21;q34.1) that involves NUP214/CAN and SET.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DATABASE: NAME-Atlas Genet. 1. Vatl. Acad. Sci. U.S.A. 91:1519-1523 (1994).

1. FUNCTION: May serve as a docking site in the receptor-mediated import of substrates across the nuclear pore complex.

1. SUBUNIT: Homodimer. Interacts with DDX19 and NUPSB.

1. SUBCELLULAR LOCATION: Nuclear pore complex. Cytoplasmic filaments.

1. TISSUE SPECIFICITY: Expressed in thymus, spleen, bone marrow, kidney, brain and testis, but hardly in all other tissues or in whole embryos during development.

PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. Pro-1153 is the only 3-hydroxypro and the only hydroxylated proline in position X. SIMILARITY: Contains 1 WWFC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the

"Nucleotide sequence of a collagen cDNA-fragment coding for the
carboxyl end of pro alpha 1(I)-chains.";

FES Lett. 111:61-65(1980).

-I- FUNCTION: Type I collagen is a member of group I collagen

(fibrillar forming collagen).

-I- SUBUNT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-I- SIBSUE SPECIFICITY: Forms the fibrils of tendon, ligaments an
bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE OF 981-1453 FROM N.A.

J. Blol. Chem. 275:2644-26149(2000).
-! FUNCTION: Transcriptional activator that binds to the regulatory region of MMP3 and thereby controls strongelysin expression. It stimulates the activity of various transcriptional activators such as JUN, SPI, PAX6 and ETS1, suggesting a function as a

PTM: Sulfated on 40% of tyrosines.

DISBARS: Defects in COL5A1 are a cause of Ehlers-Danlos syndrome type I (EDS-I) [MIM:130000]; also known as Ehlers-Danlos syndrome gravis. EDS-I is a connective-tissue disorder characterized by loose-jointedness and fragile, velvety, stretchable, bruisable skin that heals with peculiar 'cigarette-paper' scars. Inheritance is autosomal dominant.
                                                                                                                                                 -!- DISBASE: Defects in COLSAl are a cause of Bhlers-Danlos syndrome type II (BDS-II) [MIM:13010]; also known as Bhlers-Danlos syndrome mitis. Inheritance is autosomal dominant.
-!-SIMILARITY: HIGH, TO ALPHA 3(V) AND ALPHA 1(XI) CHAINS.
-!-SIMILARITY: CONtains 1 TSP N-terminal (TSPN) domain.

DISEASE: Defects in COLILA2 are the cause of Stickler syndrome type 3 (STL3) [MIM:184840]. STL3 is an autosomal dominant disorder characterized by oro-facial, auditory and skeletal manifestations,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                beginning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               such as midfacial hypoplasia, cleft palate, osteoarthritis, and sensorineural hearing loss. Differently from Stickler syndrome type 1 and 2, no coular involvement is observed. This disorder is also referred to as Stickler-like syndrome or non-ocular Stickler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DISEASE. Defects in COL11A2 are the cause of autosomal dominant monsyndromic sensorineural deafness type 13 (DFNA13) [MM:601868] Affected individuals experience progressive hearing loss beginnin in the second to fourth decades, eventually making use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DISEASE: Defects in COL11A2 are the cause of autosomal recessive otospondylomegaepiphyseal dysplasia (OSMED) [MIM:215150], a several dysplasia accompanied by severa hearing loss. The phenotype overlaps that of autosomal dominant skeletal disorders (Stickler and Marshall syndromes) but can be distinguished by disproportionately short limbs and lack of ocular involvement. DISEASE: Defects in COL11A2 are the cause of Weissenbacher Zweymueller syndrome (WZS) [MIM:277610], an autosomal dominant disorder allelic with STL3 and OSMED. WZS is also referred to as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: BELONGS TO THE FIBRILLAR CLASS OF COLLAGENS.
SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

```

Pred. No. 0.00017;

```
DOMAIN: Alpha chains of type IV collagen have a noncollagenous domain (NC1) at their C-terminus, frequent interruptions of the G-X-Y repeats in the long central triple-helical domain (which may cause flexibility in the triple helix), and a short N-terminal triple-helical 7S domain.

PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

PTM: Type IV collagens contain numerous cysteine residues which are involved in inter- and intramolecular disulfide bonding. 12 of these, located in the NC1 domain, are conserved in all known type

                                                                                                                                                                                                                                                                                               -!- FUNCTION: Thought to be required for maintaining cell proliferation.
-!- SUBCELLULAR LOCATION: Nuclear. Predominantly localized in the G1 phase in the perinucleolar region, in the later phases it is also detected throughout the nuclear interior, being predominantly localized in the nuclear matrix. In mitosis, it is present on all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isocial P46013-2; Sequence-VSP 004298;
Isocial STAGE: Expression of this antigen occurs
DEVELOPMENTAL STAGE: Expression of this antigen occurs
preferentially during late 61, S, G2 and M phases of the cell
cycle, while in cells in G0 phase the antigen cannot be detected.
SIMILARITY: Contains 1 FHA domain.
                                                                                                                                                                          "The cell proliferation-associated antigen of antibody Ki-67: a verlarge, ubiquitous nuclear protein with numerous repeated elements, representing a new Kind of cell cycle-maintaining proteins."; J. Cell Biol. 123:513-522(1993).

"Two mRNAs of mouse pro alpha 1(I) collagen gene differ in the size of the 3'-untranslated region.";

Nucleic A-untranslated region.";

Nucleic Sec. 16:773-773 (1988).

-!- FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen).

-!- FUNCTION: Trimers of an ealpha 2(I) and two alpha 1(I) chains.
-!- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hydroxyapatite. Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. SIMILARITY: Contains 1 VWFC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Monson J.M., Friedman J., McCarthy B.J.;
